3. name.py (30)

Write a program that gets a string containing a person's first, middle, and last names, and displays their first, middle, and last initials. For example, if the user enters Susan Smith Miller, the program should display S.S.M.

Define main():

Declare Local variables

Prompt user to enter the full name

Use split method to split the full name

User **for** loop to get first character of each name as an initial

Display output

Sample output:

Enter your full name: Susan Smith Miller
S.S.M.
